MODULE 16

Capstone Presentations & Next Steps

Duration	Format	Audience	Day / Position
45 min	**Presentations + Workshop**	**Mixed Engineers**	**Day 2 / Final**

MODULE OVERVIEW

This final module brings the course full circle. Participants present their Lab 3 sprint results, give and receive peer feedback, build a personal AI adoption plan, and leave with a clear roadmap for applying Claude Code in their daily work at TI.

SESSION TIMING

0:00 – 0:20	**Section 1: Sprint Presentations & Peer Review**
0:20 – 0:30	**Section 2: Personal AI Adoption Plan**
0:30 – 0:38	**Section 3: Resources, Community & Continued Learning**
0:38 – 0:43	**Section 4: Course Wrap-Up & Feedback**

0:00 – 0:20	SECTION 1: Sprint Presentations & Peer Review

1. Sprint Presentations & Peer Review

1.1 Presentation Format

Each participant (or pair) presents their Lab 3 feature sprint in 2–3 minutes. The format is intentionally short and focused: this is a sprint demo, not a keynote.

Show	Don't Show
Your sprint-plan.md — how you decomposed the feature	Every line of code you wrote
Key decisions: which approach, which trade-offs	A walkthrough of the full codebase
One interesting Claude Code interaction that saved time	Slides or PowerPoint (this is a live demo)
Test results: coverage %, tests passing	Apologies for what you didn't finish
One thing you'd do differently	Long explanations of basic concepts

```
# Quick presentation script (run before presenting):
> Generate a 2-minute sprint demo summary:
> 1. Feature built: [one sentence]
> 2. Plan: [files created/modified, approach]
> 3. Key technique: [which Claude Code feature helped most]
> 4. Quality: [test count, coverage %, lint status]
> 5. What I'd do differently: [one thing]
> Output as bullet points.
```

1.2 Peer Review Framework

While each person presents, the audience uses this peer review framework to provide structured feedback:

Dimension	What to Evaluate	Score (1–5)
Decomposition	Was the feature broken into clear, implementable steps?	
Claude Code usage	Did they use the right techniques (plan mode, subagents, quality gates)?	
Code quality	Tests passing, coverage, lint clean, production error handling?	
Decision making	Good trade-offs? Scope management? Knew when to simplify?	
Presentation	Clear, concise, showed results not just process?	

```
# Peer review prompt (each reviewer):
```

```
> Based on what I just saw, give structured feedback:
> - Strengths (what worked well)
> - Suggestions (what could improve)
> - Question (one thing I'd ask about their approach)
> Keep each to one sentence.
```

☆ **KEY POINT:** Peer review is a skill. The goal is specific, actionable feedback — not generic praise. "Your decomposition was clear" is better than "good job." "You could have used plan mode before the refactor step" is better than "needs improvement."

0:20 – 0:30	SECTION 2: Personal AI Adoption Plan

2. Personal AI Adoption Plan

2.1 From Training to Practice

The biggest risk after any training: you go back to your desk on Monday and nothing changes. The adoption plan prevents this by giving you a concrete, time-bound commitment to apply what you learned.

2.2 Build Your Plan

Take 5 minutes to fill in your personal adoption plan. Be specific — names, dates, projects.

Question	Your Answer
1. First project: Which TI project will you use Claude Code on first?	
2. This week: What's one thing you'll do with Claude Code in the next 5 days?	
3. CLAUDE.md: Will you create a team CLAUDE.md? By when?	
4. Subagent: What's the first subagent you'll create for your team?	
5. CI integration: Will you add Claude to your CI pipeline? Which check first?	
6. Buddy: Who on your team will you pair with to practice Claude Code?	
7. 30-day goal: What measurable outcome will you achieve in 30 days?	
8. Blocker: What's the biggest obstacle to adoption? How will you address it?	

2.3 Common Adoption Patterns at TI

Week	Action	Deliverable
Week 1	Set up Claude Code on your work machine. Create CLAUDE.md for one project. Use for one real task.	CLAUDE.md committed to repo
Week 2	Create a code reviewer subagent for your team's coding standards. Share with team.	sensor-reviewer.md in .claude/agents/

Week 3	Add Claude to one CI check (PR review or failure analysis). Run for one sprint.	GitHub Actions workflow live
Week 4	Run a tech debt audit on your main project. Present findings to team lead.	docs/tech-debt.md with prioritized remediation
Month 2	Establish team-wide CLAUDE.md standards. Train one colleague on Claude Code basics.	Team using Claude Code consistently
Month 3	Measure impact: time saved per PR, test coverage improvement, CI failure resolution time.	Metrics report for management

☆ **KEY POINT:** The most successful adopters start small: one project, one subagent, one CI check. They don't try to transform their entire workflow on day one. They build evidence of value, then expand.

0:30 – 0:38	SECTION 3: Resources, Community & Continued Learning

3. Resources, Community & Continued Learning

3.1 Essential Resources

Resource	URL	What You'll Find
Claude Code Docs	docs.anthropic.com/claude-code	Official docs, command reference, configuration
Claude Code GitHub	github.com/anthropics/claude-code	Source, issues, changelog, examples
Anthropic Cookbook	github.com/anthropics/anthropic-cookbook	Recipes for common patterns
Prompt Engineering Guide	docs.anthropic.com/en/docs/build-with-claude/prompt-engineering	Advanced prompting strategies
MCP Servers	github.com/modelcontextprotocol/servers	Community MCP servers catalog
Claude API Docs	docs.anthropic.com/en/api	API reference for headless integration

3.2 Staying Current

Channel	Why
Anthropic Blog (anthropic.com/news)	New features, model updates, case studies
Claude Code Changelog (in docs)	Release notes for every update
GitHub Issues (claude-code repo)	Bug reports, feature requests, community solutions
Internal TI Slack/Teams channel	Create a #claude-code channel for your team to share tips

3.3 Advanced Topics for Self-Study

Topic	Starting Point
Custom slash commands	docs.anthropic.com/en/docs/claude-code/slash-commands
MCP server development	Build your own MCP server for TI-specific tools
Claude Code SDK	Programmatic control of Claude Code from Python/Node.js
Multi-repo workflows	Managing Claude across monorepos and multi-service architectures
Fine-tuning subagent prompts	Iterate on system prompts based on review of agent output quality
Cost optimization	Monitor API usage, choose optimal models (Sonnet vs. Opus vs. Haiku) per task

0:38 – 0:43	SECTION 4: Course Wrap-Up & Feedback

4. Course Wrap-Up & Feedback

4.1 What You've Accomplished

In two days, you've gone from zero to a complete AI-assisted development workflow:

✅ Day 1 Morning: Understood vibe coding, mastered prompting (zero-shot to CoT), configured Claude Code (CLI + VS Code), and set up CLAUDE.md for team standards.

✅ Day 1 Afternoon: Built a Python sensor toolkit from scratch (Lab 1), learned refactoring and debugging patterns, and mastered AI-driven quality assurance with BICEP testing.

✅ Day 2 Morning: Integrated Claude Code into CI/CD (GitHub Actions), learned subagents (planner/reviewer/tester), used plan mode and MCP, and completed the assistant loop (Lab 2).

✅ Day 2 Afternoon: Ran parallel tasks with worktrees, automated PR workflows, applied production patterns and tech debt analysis, and completed a 60-minute feature sprint (Lab 3).

4.2 The TI Vibe Coding Toolkit

Here's everything you take away from this course:

Asset	Location	Purpose
CLAUDE.md template	Your Lab 1 project	Team coding standards for Claude Code
Subagent collection	.claude/agents/	Reviewer, planner, tester agents
CI/CD workflows	.github/workflows/	AI review, failure analysis, release notes
Quality gate script	Project root	Automated lint, test, coverage, complexity checks
PR template	.github/PULL_REQUEST_TEMPLATE.md	Standardized PR descriptions
Tech debt analysis	docs/tech-debt.md	Prioritized remediation plan
Sprint plan template	docs/sprint-plan.md	Decomposition framework for new features
Personal adoption plan	Your notes	Week 1–4 action items with deliverables

4.3 Course Feedback

Your feedback directly improves this course for future sessions. Please take 2 minutes to complete the feedback form:

Question	Rating (1–5)
Overall course quality	
Relevance to my daily work at TI	

Balance of theory vs. hands-on practice	
Instructor knowledge and delivery	
Lab exercises (Labs 1, 2, 3)	
Pace and timing of sessions	
What was the most valuable module?	(write in)
What should we add or change?	(write in)
